

Safety Tips

- Forklift cylinders should only be filled by trained personnel using proper safety procedures
- **DO NOT** smoke while handling propane cylinders
- If you detect a leak, shut off valves and place the cylinder outside
- If a leak develops while the container is installed on a piece of equipment, shut off the container and equipment, if it is safe to do so. If it is not safe to shut down, or if the leak persists, evacuate the area and contact emergency services. Never remain in the area if propane vapors are detected.
- Contact your propane provider to repair or replace propane tank
- When not in use always close all propane valves
- Store all cylinders in safety storage racks away from any source of ignition or extreme heat
- Always read warning labels attached to propane cylinders
- Direct contact with propane will cause freeze burns to skin
- Remember, propane is a hazardous material, treat it with respect!
